## Human Factors - Supporting Safety Learning from Accidents

---

Human Factors and the RSSB Research Programme

Role of Human Factors in Incident Investigation

Example results on Verbal Communication Issues

Human Reliability

# Human Factors

- The optimisation of human performance in the workplace.
- Considers the working environment from a human-centred viewpoint, looking at the whole system and its influence on the way people behave and interact with the railway.

## RSSB R&D Programme

---

- Funded by the UK Department for Transport; ~£9 million per year
- Managed for industry by RSSB
- Programme scope: engineering, operations and management
- Research that no one company or sector could solve on its own
- A balanced programme of tactical improvements and strategic change
- SPARK for railway knowledge sharing and information:
  - free to access and open to anyone, anywhere
  - access to a range of international publications
  - information on research projects and initiatives
  - pointers to test facilities and centres of expertise.
  - [www.sparkrail.org](http://www.sparkrail.org)

# Development Process: HF and Incident Investigations

---

1. Demonstrating the value of human factors data from investigations
  - An analysis of formal investigation and inquiries (SPARK Ref. T635)
2. Creating the software and framework to record human factors data in the national incident reporting system
  - Development of an incident factor classification system for SMIS (SPARK Ref. T994)
3. Supporting industry decision making and strategy with the data
  - Fatigue and its contribution to railway incidents
  - Developing a safety critical communication training package (SPARK Ref. T1078)
  - Human Factors causes of SPADs (SPARK Ref. T1128)
  - Train Driver Route Knowledge (SPARK Ref. T1108)

# Investigation Framework

## SMIS Classification System

### Human Performance

1. Slip/lapse
2. Intentional rule breaking
3. Decision error
4. The person was asleep or unable to respond to the situation

### 10 Incident Factors

-  Verbal Communication
-  Fatigue, health and wellbeing
-  Processes and procedure documents
-  Written information on the day
-  Competence management
-  Infrastructure, vehicles, equipment and clothing
-  The person's environment
-  Workload (real or perceived) and resourcing
-  Teamworking and leadership
-  Risk management

# 10 Incident Factors

## **Verbal communication**

The exchange of spoken information concerned with how safety critical information is communicated between staff

## **Fatigue, health and wellbeing**

The individual's fatigue, health and wellbeing which is the joint responsibility of the organisation and the member of staff

## **Process and procedure documents**

Written rules, standards, processes and methods of working which guide and structure activities undertaken

## **Written information on the day**

Information that can be renewed day-to-day or week-to-week, and supports people in carrying out an activity or task

## **Competence management**

The company competence management systems regarding selection, training and assessment

## **Infrastructure, vehicles, equipment and clothing**

The infrastructure, vehicles, equipment or clothing used to undertake or support a task

## **The person's environment**

The environmental stressors such as lighting levels, noise and temperature which can affect the performance of a person

## **Workload (real or perceived) and resourcing**

Workload is the demands on a person which are influenced by the task, its context, the individuals who carry out the activity, and resourcing

## **Teamworking and leadership**

How people are organised to work together, and how they relate to and influence each other to undertake their work safely

## **Risk management**

The processes used to identify, assess, reduce and monitor potential safety concerns

# Results on verbal communication issues

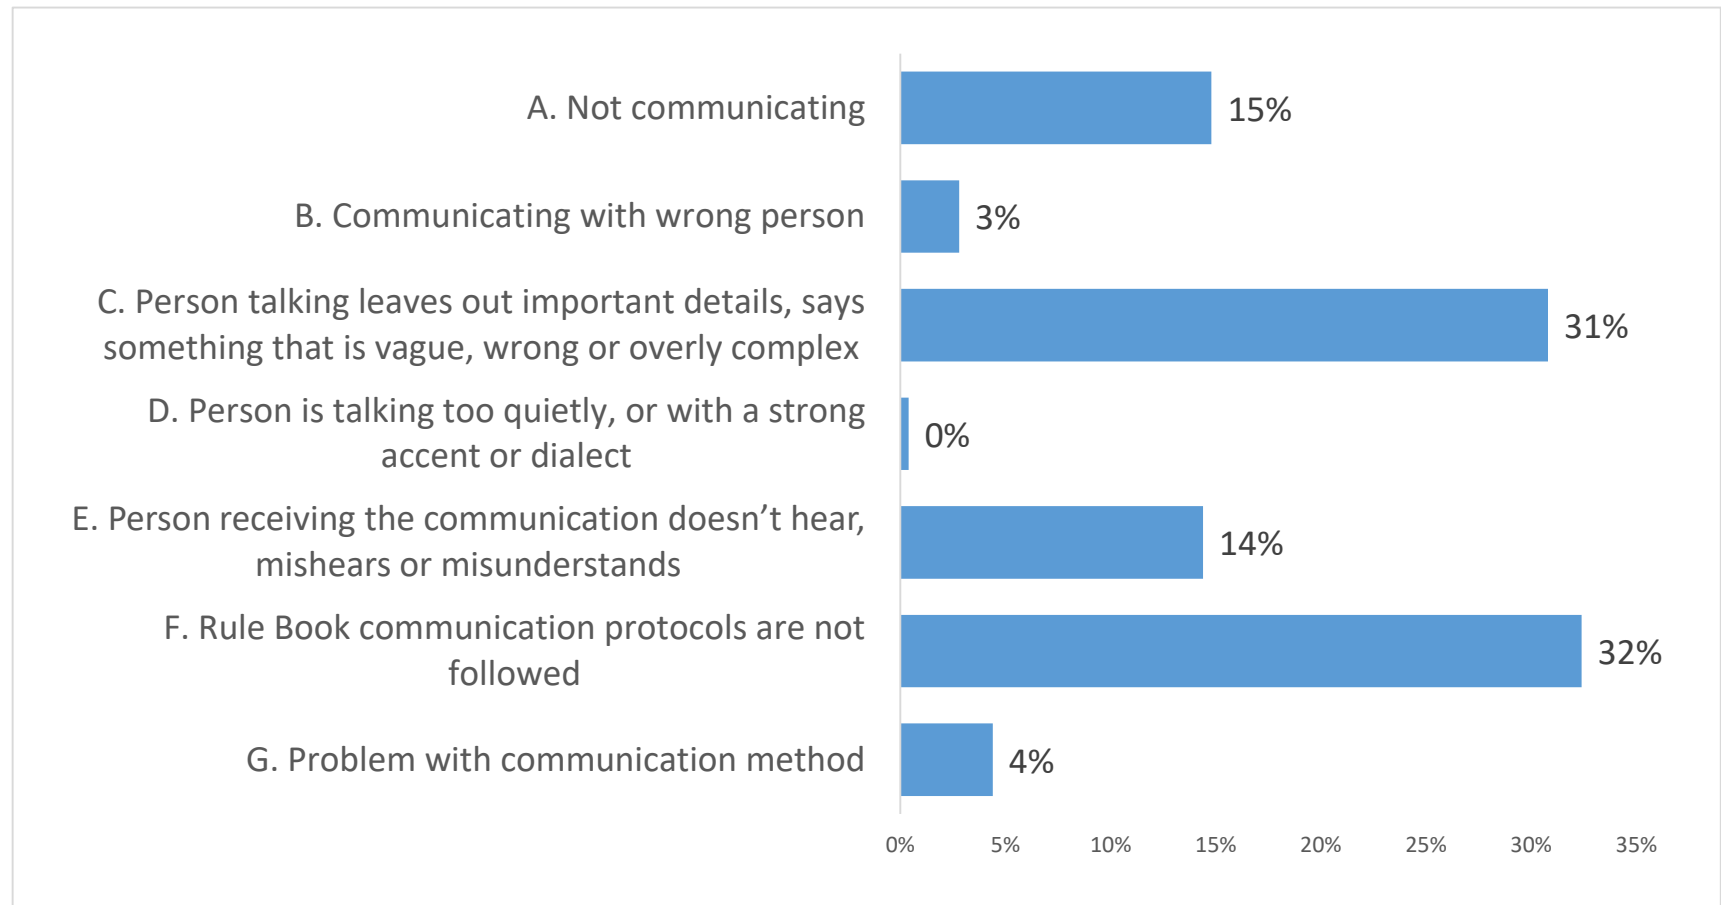

## Example Analysis Output – Safety Critical Communications

---

- Verbal communications contributing to incidents:
  - What types of communication issue?
  - What safety management issues contribute to communication issues?
- Sample of 95 GB investigation reports involving communications as a factor (SPADs, track worker near miss, derailment, collision)
- Applied the HF framework in the SMIS database
- Identified 541 incident factors in 95 incidents (average 6 per incident)
  - 383 communication issues
  - 158 underpinning safety management issues from the 10 incident factors

# Communication Factors Issues

# Underpinning Safety Management Factors

10 incident factors	Total	%age
Workload (real or perceived) and resourcing	22	18%
Infrastructure, vehicles, equipment and clothing	22	18%
Fatigue, health and wellbeing	21	17%
Competence management	19	15%
Processes and procedure documents	16	13%
Written information on the day	15	12%
Teamworking and leadership	4	3%
Risk management	3	2%
The person's environment	3	2%
<b>Total</b>	<b>125</b>	<b>100%</b>

## What did we do with the data?

---

- Fed in to a national training package to support consistent communication competence development across the GB rail industry
- Project: “Developing a safety critical communication training package” (SPARK Ref. T1078)
- Following slides use the incident data to provide background for the national training course

# 01

## **Safety Critical Communications**

**MODULE: FOUNDATION**

**1 in 5**

**accidents involves a  
communication **error.****

**ACCIDENTS**

**TIME**

# Errors include:

**Leaving out  
important details**

**Saying something  
vague**

**Not  
communicating  
when you should**

**Not following  
basic protocols**

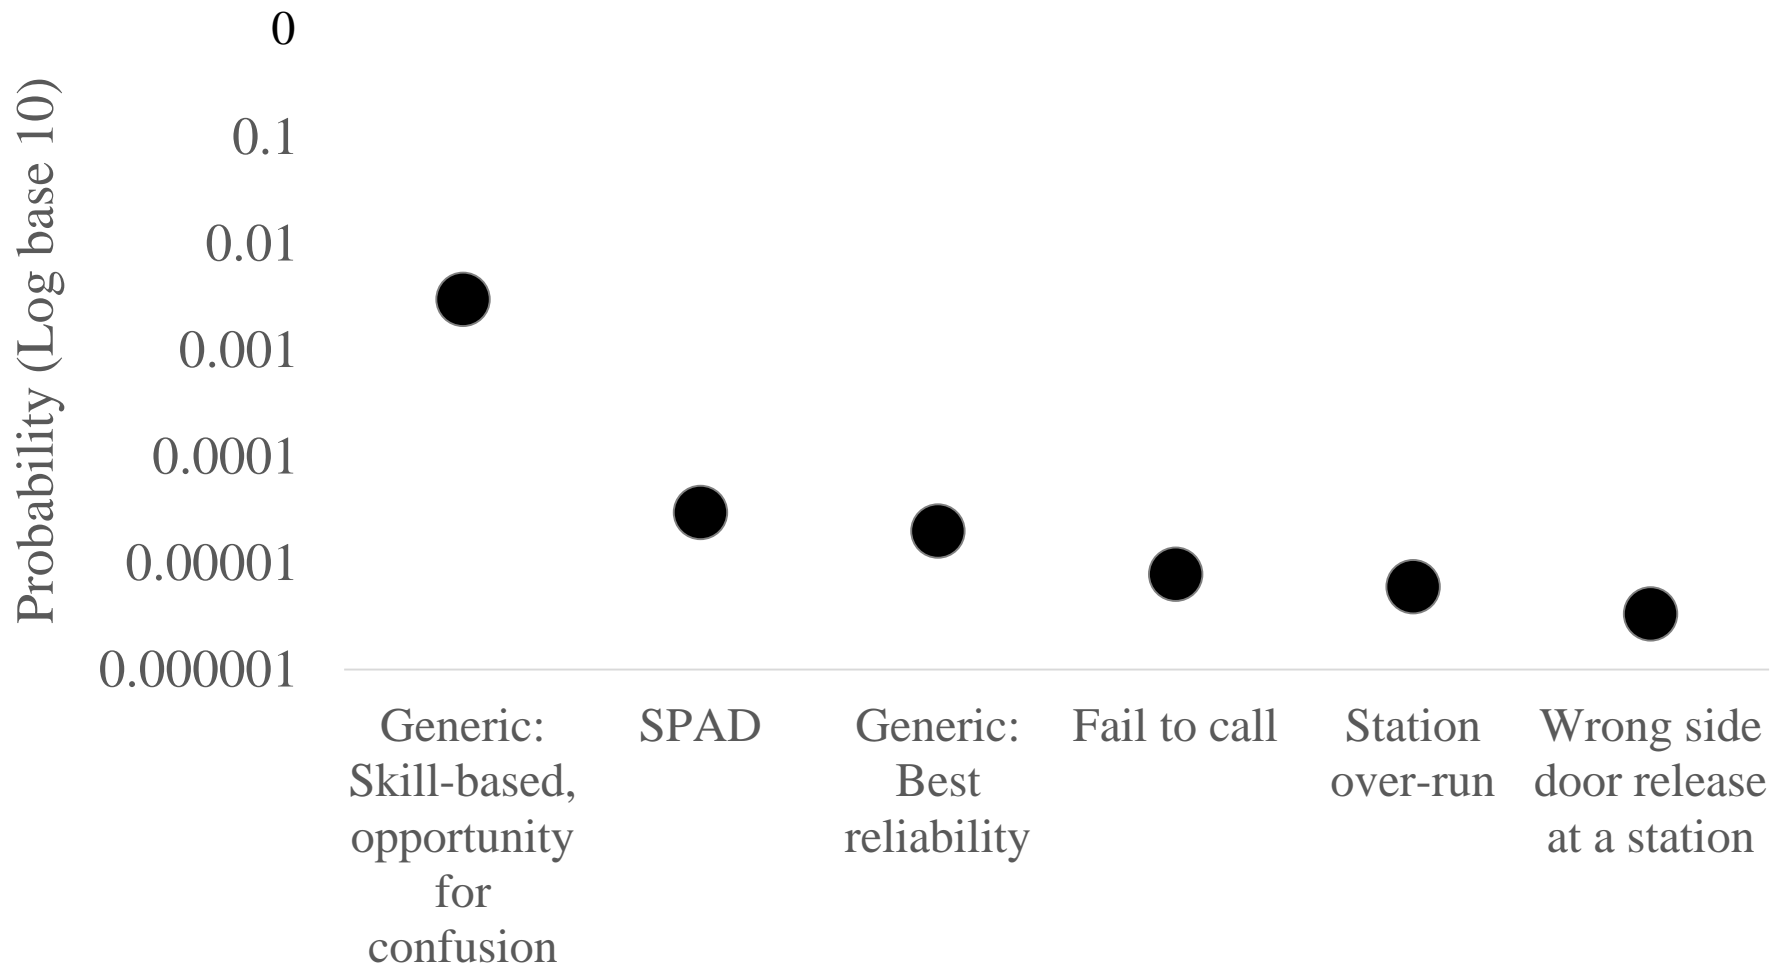

Analysis done as part of this training shows that communications mistakes occur across the rail industry and are not the fault of one group of workers.

# Human Reliability

# Understanding human performance reliability: the data

## Tools To Develop Our Understanding of Performance Reliability

---

- Railway Action Reliability Assessment (Spark Ref. T270)
  - Supports human reliability assessment, quantification of human performance and provides generic estimates of human performance reliability
  
- Red Aspect Approaches to Signals (RAATS, Spark Ref. COF-UOH-24)
  - Allows Rail companies to harness the power of big data to identify the signals which are most frequently approached at red, thanks to a new on-line tool developed by rail industry body RSSB and the University of Huddersfield.

# Conclusions

# Conclusions: Role of Human Factors in Supporting Safety Learning from Accidents

---

- Human factors central to the incident investigation process
  
- Human factors investigation outputs used to inform industry strategy and develop cross-industry support
  
- Process enabled by the GB Research Programme funded by the Department for Transport and managed by RSSB:
  - Development of HF approach
  - Development of software
  - Research used to deliver changes to industry (eg SPAD strategy, standards for on-train camera monitor systems, communications competence)

The image features a central horizontal band of bright blue. Above this band are three vertical rectangular blocks: a light green block on the left, a dark teal block in the middle, and a vibrant green block on the right. Below the blue band are three more vertical rectangular blocks: a medium blue block on the left, a dark navy blue block in the middle, and a dark forest green block on the right. The text "Thank you" is centered within the blue band.

Thank you
