

Universal AI Interacted Automated Scenario Tester (AI-AST)

Automatically generates, executes, and verifies different simulation test scenarios for railway signalling systems to achieve tests to the maximum possible extent in accordance with international standards, thus improving railway safety.

Problem to tackle

Hong Kong has one of the busiest railway networks globally, handling around 5.5 million passenger journeys daily. Urban railway signalling systems are being upgraded to meet the city's growing travel needs. Signalling systems prioritise passenger safety and ensure precise train control for optimal railway operations.

Incomplete Coverage

A 16-station railway line may have up to 230,000 simulation cases, each requires about 15 minutes for manual verification to ensure a defect-free system.

Long Testing Time

Human Errors

MISSION IMPOSSIBLE?

Technology

Robotic Process Automation (RPA) automates control of simulator and execute test steps

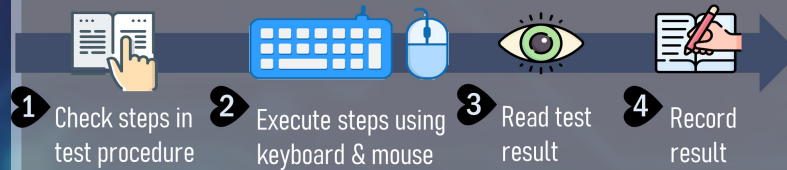

AI Algorithms handles image recognition and result verification

Conventional

Manual Operation

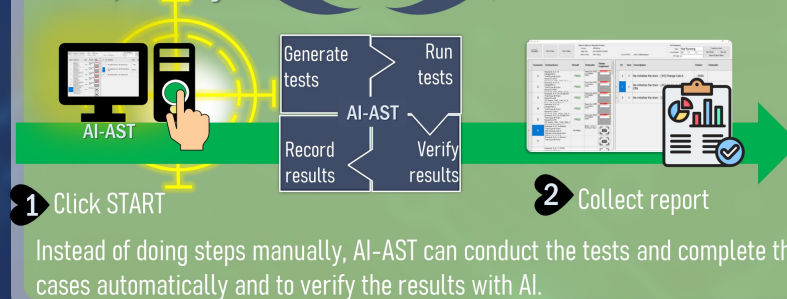

In-cab Simulator

Automatic Train Supervision

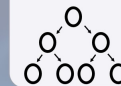

Now, newly with AI-AST

Automatic!

Benefits

Multiplying Time Saving

Replicable

Plug-in Program

Universal

Eliminate Human Error

Accuracy

Maximise Testing

Automated

Way forward

1 With its universal design, AI-AST is expandable to apply on other brands of signalling system testing and other projects.

2 Plan to introduce the inclusion of automated simulation tester in relevant international standard and as standard specification of new signalling systems project.
